

# Countries with greater women’s political empowerment experience more peace.

## Women and World Peace

### Introduction

In the iconic movie [Miss Congeniality \(2000\)](#), contestants in the Miss United States pageant are asked the question “What is the one most important thing our society needs?” to which the women all give the classic answer “world peace.” But what role do women play in achieving the lofty goal of world peace? Well, according to Hudson et al. (2014), women have everything to do with world peace. Hudson et al. argue that gender inequality is linked, both empirically and theoretically, to national and international security in their book *Sex and World Peace*. While the book discusses women’s security and gender equality in a variety of areas such as personal relationships, health, and education, this analysis focus on women’s political empowerment.

**Research question:** What impact does women’s political empowerment on world peace?

The expected result of this analysis is to find a positive relationship between women’s political empowerment and world peace.

### Methods

The data used in this analysis was compiled by Dahlberg et al. (2024) from the Quality of Government (QOG) Institute, pulling from a variety of publicly available datasets. This data is from 2020 and includes indicators from 194 countries on a variety of areas such as civil society/population/culture, conflict, education, gender equality, health, political system, economics, and quality of government.

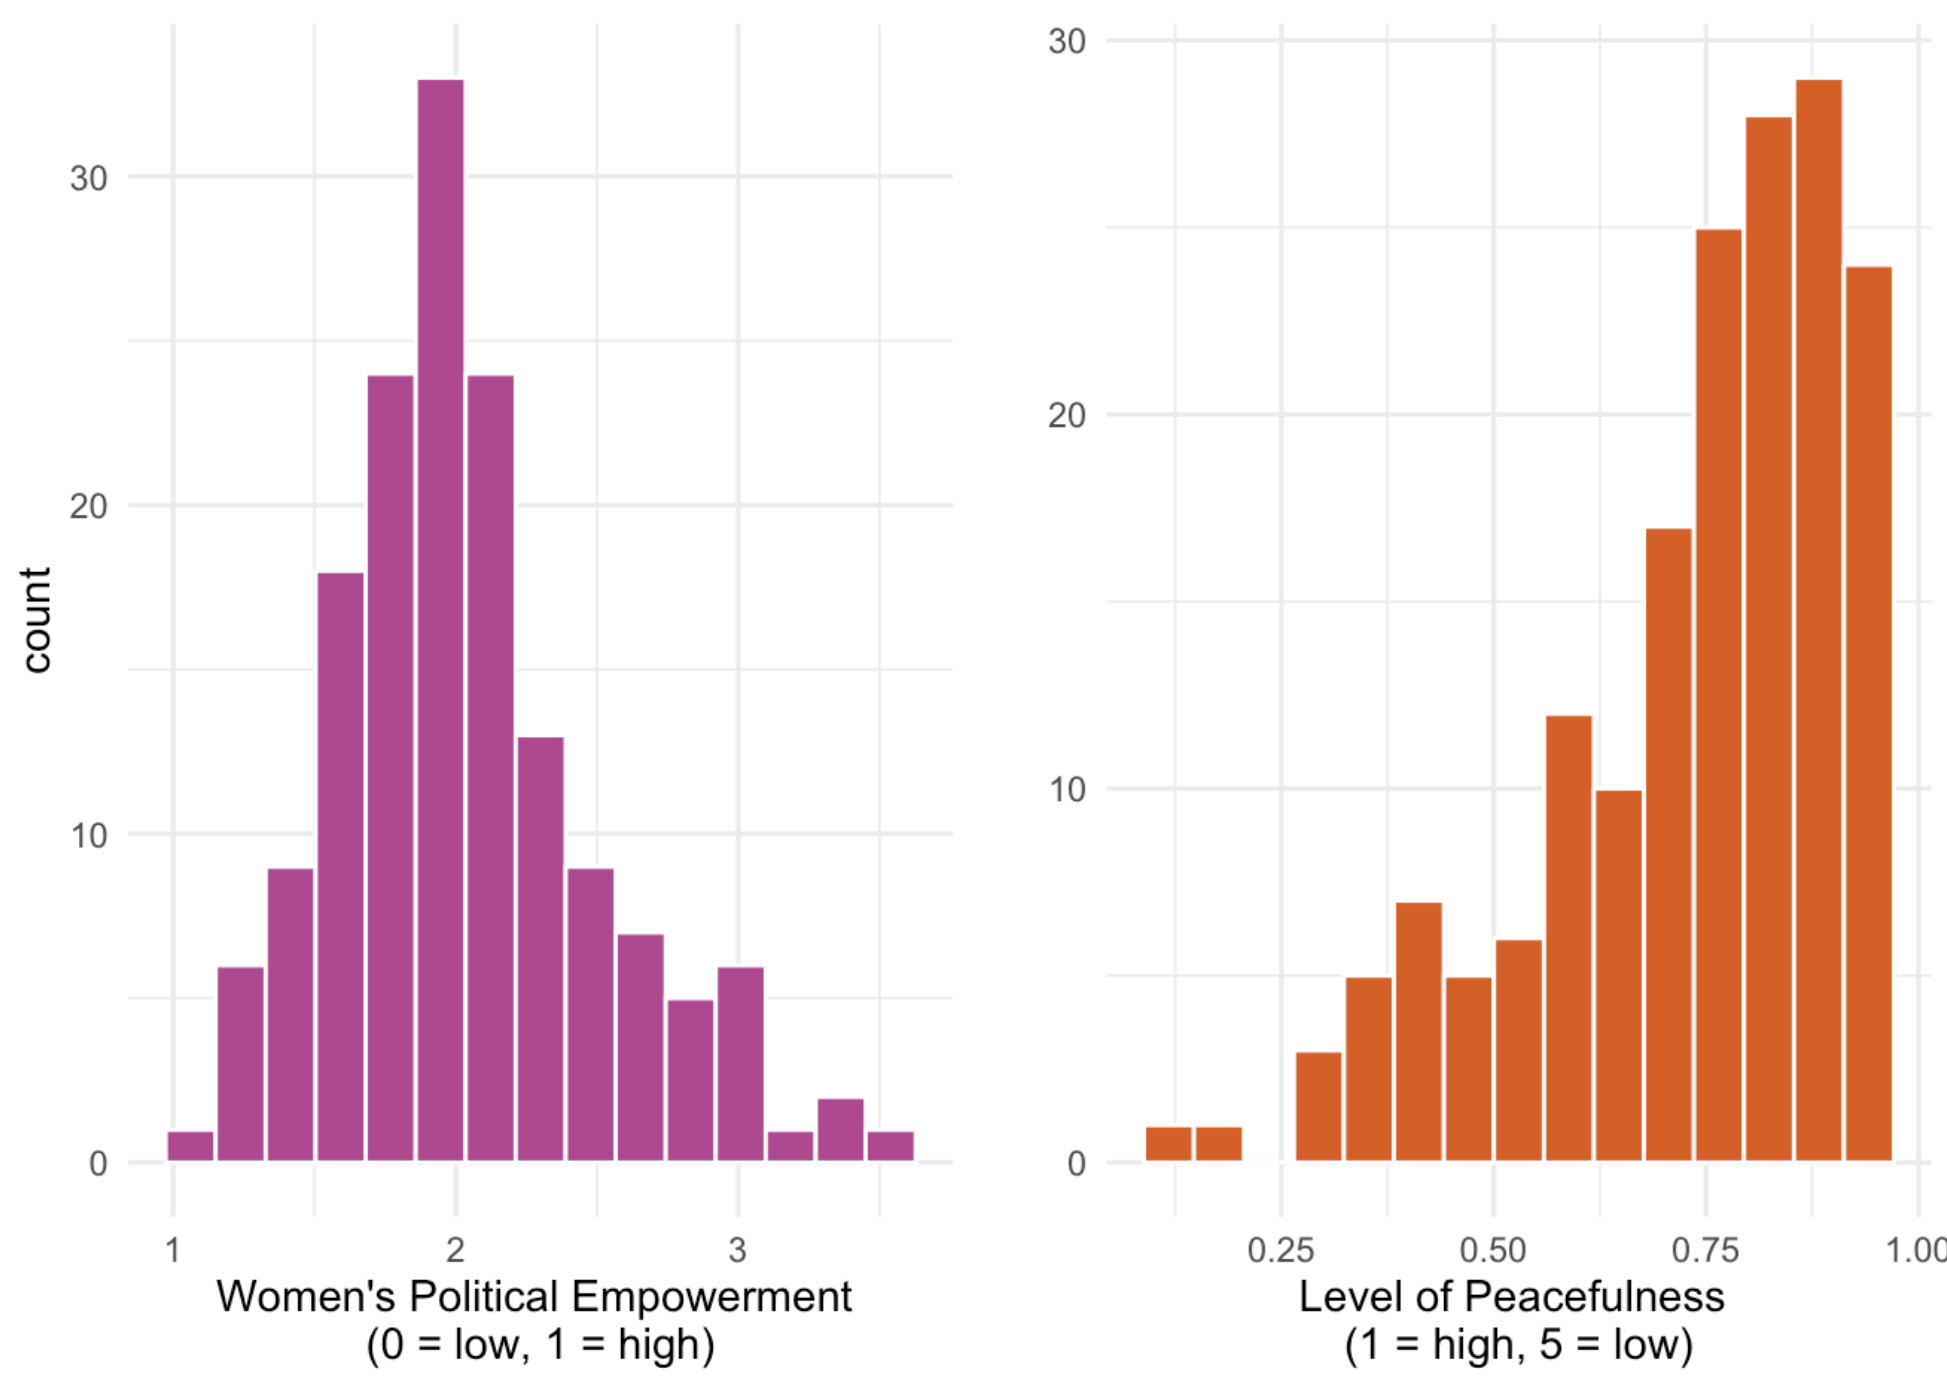

The variables that are used in this analysis include the following:

- **Global Peace Index** ([gpi\\_gpi](#)): Values fall on a continuous scale ranging from 1-5, with 1 representing the most peaceful countries and 5 representing the least peaceful countries. Areas incorporated into this index include ongoing domestic and international conflict and the level of harmony or discord within a nation. Specific indicator examples include duration of involvement in conflicts, crime rates, violent demonstrations, and internal displacement (Institute for Economics & Peace, 2022).
- **Women’s Political Empowerment Index** ([vdem\\_gender](#)): Values fall on a continuous scale from 0-1, with 1 indicating higher political empowerment. This index incorporates three dimensions: fundamental civil liberties, women’s open discussion of political issues and participation in civil society organizations, and the descriptive representation of women in formal political positions (Pemstein et al., 2023).
- **Gender Inequality Index** ([gii\\_gii](#)): Values fall on a continuous scale ranging from 0-1, with 1 indicating higher disparity. It measures gender inequality in three areas: reproductive health, empowerment, and economic status (UNDP, 2022).
- **Economy Status** ([bti\\_mes](#)): Values fall on a continuous scale ranging from 1-10, with 10 indicating higher economy status. It scores countries base on the level of socioeconomic development, the organization of the market and competition, currency and price stability, private property, the welfare regime, economic performance, and sustainability (Donner et al., 2022).
- **Population** ([pwt\\_pop](#)): Values are the population of a country in millions (Feenstra et al., 2015).

- **Adult Literacy Rate** ([wdi\\_litrad](#)): Values are the percentage of people ages 15 and above who can with understanding, read and write a short, simple statement on their everyday life (World Bank, 2023).

More information on each variable can be found in *Figure 1* and *Table 1*.

**Figure 1: Distribution of Women’s Political Empowerment and Levels of Peacefulness**

**Table 1: Descriptive Statistics**

variable	min	max	mean	median
<a href="#">gpi_gpi</a>	1.1	3.6	2.0	2.0
<a href="#">vdem_gender</a>	0.1	1.0	0.7	0.8
<a href="#">gii_gii</a>	0.0	0.8	0.3	0.4
<a href="#">bti_mes</a>	1.2	9.4	5.3	5.4
<a href="#">pwt_pop</a>	0.1	1433.8	44.3	10.0
<a href="#">wdi_litrad</a>	27.3	100.0	84.1	92.3

### Results

To determine the relationship between women’s political empowerment and world peace, I create a linear regression model that used the [vdem\\_gender](#) variable as the independent variable and [gpi\\_gpi](#) as the dependent variable. Results can be seen in *Table 2*. The variable to measure peace is a range from 1 (most peaceful) to 5 (least peaceful) and the variable to measure empowerment is a range from 0 (least empowered) to 1 (most empowered) so the negative relationship presented by the data can be interpreted as a positive relationship between more peace and greater empowerment.

I produced additional linear regression models adding potential confounding variables. In the second linear regression model, I added [gii\\_gii](#) to account for other areas of gender inequality in a country that could affect peace. In the third linear regression model, I added economic status, population, and literacy as measured by the variables [bti\\_mes](#), [pwt\\_pop](#), and [wdi\\_litrad](#). Results can be seen in *Table 2*.

**Table 2: Linear Regression Model**

	(1)	(2)	(3)
(Intercept)	3.20*	2.50*	3.18*
<a href="#">vdem_gender</a>	-1.58*	-1.06*	-0.51*
<a href="#">gii_gii</a>		0.91*	-0.07
<a href="#">bti_mes</a>			-0.13*
<a href="#">pwt_pop</a>			0.00
<a href="#">wdi_litrad</a>			0.00
Num.Obs.	159	153	107

\* p < 0.05

**Figure 2: Relationship Between Women's Political Empowerment and Peace**

### Findings

The results from these linear regression models fail to reject the null hypothesis, meaning that there is a statistically significant relationship between women’s political empowerment and world peace. I found that countries with greater women’s political empowerment are associated with higher levels of peace. This relationship is visually represented in *Figure 2*. While these findings to not prove causation, this correlation is consistent with the arguments presented by Hudson et al. and can be used to justify policies and programs to enhance women’s political empowerment globally with the intention of creating a more peaceful world.
